

ARTIFICIAL INTELLIGENCE.

Definition of AI:

AI is a field of computer science that enables machines to think like human beings and take decisions according to the situation based on the provided data.

Examples of Narrow AI:

Google maps.

Google assistant.

Image and speech recognition.

Applications of AI in Healthcare Sector:

MRI.

X-RAY.

CT Scans.

AI Role in Solving Real World Problems:

AI is playing significant role in addressing climate change and promoting environment sustainability like rising global temperature. Where AI models are used to predict long range weather forecasts allowing communities to respond the severe weather conditions properly.
